

Powering a circular economy

A circular economy is not just a distant dream for a faraway future. We can see it in action right now.

We started renting our spare rooms, and now the world's second largest hotel chain has not had to build a single hotel.

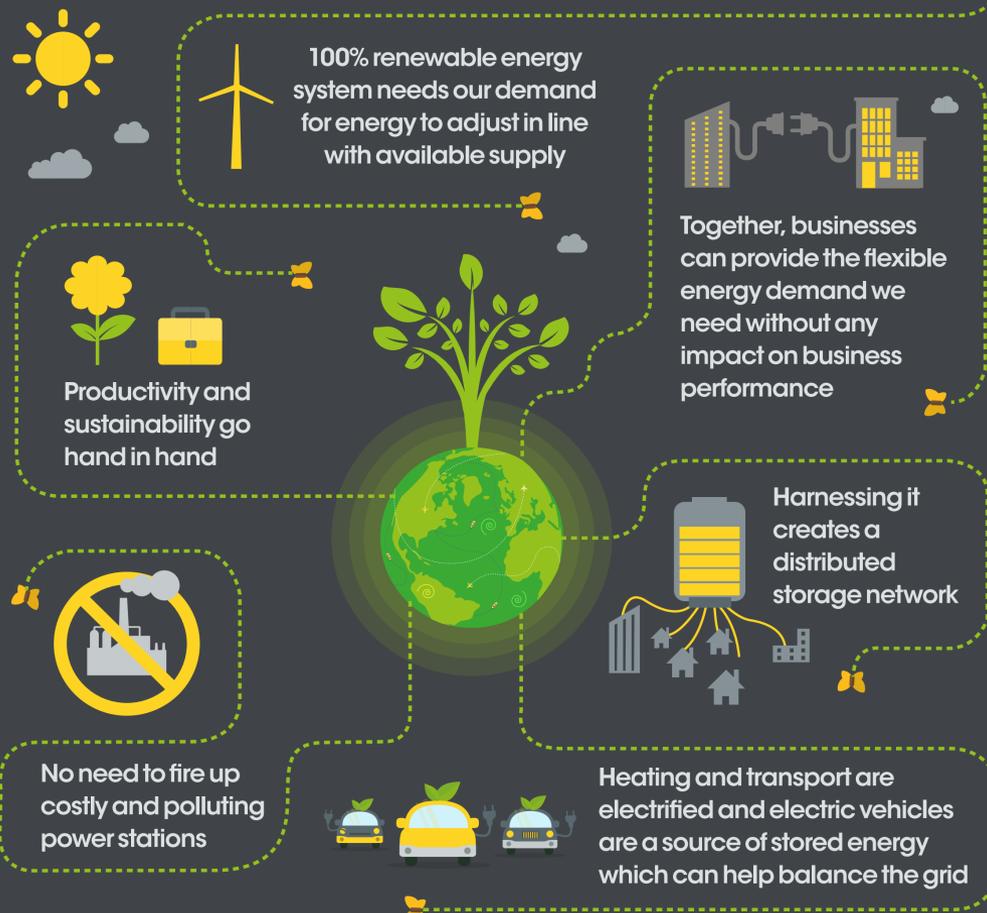

Biorefineries are using new technologies to turn organic waste into heat & power, bioplastics and fertilisers.

Circular repair models are offering customers a same day service to fix electrical goods, from mobile phones to washing machines.

We can harness the enormous benefits of a circular economy with continued transformational change and collaboration in business.

A 100% renewable energy system is the foundation of a circular economy.

Dynamic Demand empowers energy users to drive the transformation we need for a brighter future

This fresh thinking will enable us to transition to zero carbon, and could save the UK over £1 billion by 2020¹

The benefits are enormous for us all

-  A renewable and responsive energy system
-  Better use of our resources
-  Clean and resilient cities
-  Increased productivity and sustainability
-  Huge benefits for the environment

We can all contribute to reducing the UK's carbon footprint, without even noticing the impact

Dynamic Demand creates a smarter energy system. Cleaner, cheaper, more secure, more efficient.

All without building a single thing.
